

The influences of future entrepreneurs (#29203)

This AsPredicted is just a test. It will self-destruct in 24 hours. Not an actual pre-registration.

This pre-registration is not yet public. This anonymized copy (without author names) was created by the author(s) to use during peer-review.

A non-anonymized version (containing author names) will become publicly available only if an author makes it public. Until that happens the contents of this pre-registration are confidential.

1) Have any data been collected for this study already?

No, no data have been collected for this study yet.

2) What's the main question being asked or hypothesis being tested in this study?

What are the main factors that affect the decision of a person to want to be an entrepreneur?

3) Describe the key dependent variable(s) specifying how they will be measured.

The variable "entrepreneur" indicates the pleasure that a person manifests to want to work as an entrepreneur after finishing his professional studies.

4) How many and which conditions will participants be assigned to?

Basically we would carry out the same entrepreneurship survey answered by sixth semester students, this time to first semester students in order to establish the relationship we want to reach regarding being an entrepreneur. On the other hand we want to add the question of the stratum of individuals to the initial survey and obtain another explanatory variable to the final regression.

Question to answer:

-Establish your housing stratum

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.

For the project we will make two regressions:

1. The dependent variable is "Entrepreneur" and the explanatory variables are: a dummy if it is a first semester or sixth semester of economics or finance; another variable that is "meet_businessman" which tells me if the student knows entrepreneurs; another so-called "labor_options" which indicates if the student chose to study that career because of the work options he may have and finally two combinations between the dummy and, on the one hand with "meet_business" and on the other "labor_options".

2. For the second regression, a regression similar to the previous one would be carried out: a dummy if it is a first semester or sixth semester of economics and finance; another variable that is "meet_businessman" which tells me if the student knows entrepreneurs; another called "Vocation" which tells us if the student chose to study that career by vocation with the career and finally two combinations between the dummy and, on the one hand with "meet_business" and on the other "work_options".

As for the corrections that would be made, it would be robust standard errors for each regression.

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.

We will issue observations that are incomplete, that is, that there is no answer in any question of the survey, in order to remove observations that probably do not tell me anything.

7) How many observations will be collected or what will determine sample size? No need to justify decision, but be precise about exactly how the number will be determined.

The collection will be the same, the only difference is that the sample will be expanded, since 1st semester students will be taken into account for a total of approximately 180 people.

8) Anything else you would like to pre-register? (e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)

As we mentioned above we will collect the data in the entrepreneurship survey, where it will be answered by first semester students, they will also answer the new question about what type of stratum resides, it is worth emphasizing that sixth semester students will also have that answer that question to have the total data collection.
