ASPREDICTED

Economic Social Preferences- Universidad del Rosario, Bogotá, October 2019 (#29585)

This AsPredicted is just a test. It will self-destruct in 24 hours. Not an actual pre-registration.

Created: 10/21/2019 07:57 PM (PT)
Shared: 10/22/2019 06:00 PM (PT)

This pre-registration is not yet public. This anonymized copy (without author names) was created by the author(s) to use during peer-review.
A non-anonymized version (containing author names) will become publicly available only if an author makes it public. Until that happens the contents of this pre-registration are confidential.

1) Have any data been collected for this study already?
No, no data have been collected for this study yet.

2) What's the main question being asked or hypothesis being tested in this study?
If we have people with university studies and people with primary basic education, what is the relationship between education and social orientation?

3) Describe the key dependent variable(s) specifying how they will be measured.
Participants will answer 15 questions, in which different values will be shown, where each person must determine their own payment and an external payment, taking into account that the payment to the other person will not affect theirs. In this way, to determine with this data the level of social orientation of each participant.

4) How many and which conditions will participants be assigned to?
The angle of the value of the social orientation will be determined for each of the participants
through the formula, according to the decisions of own and external payment. In orden to get a classification will be assigned to each one as altruistic, pro-social, individualistic or competitive

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.
We are going to run and econometric model, in a specific way, a regresion of ordinary least squares (OLS). Determining the the value of social orientation (Conditioned 1 = university studies level; 0 = primary basic studies level). Also, with a control variable of gender (1 = male; 0 = female) for this analysis .

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.
According with our experiences, at the moment of the test performance the last questions the people began to answer hastily. So, we decedide to ask the 15 questions but omitting the last 5 to get an appropriate results

7) How many observations will be collected or what will determine sample size? No need to justify decision, but be precise about exactly how the number will be determined.
Each of the members of the group must again carry out the survey of 15-20 people who meet the condition of having a primary basic educational level, to obtain a total of 45-60 data. In this way we are going to collect a completed database to develop our proyect.

8) Anything else you would like to pre-register? (e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)
For the correct development of this project we will rely on the questions asked and the database of the value of social orientation, which was carried out in week 4. The variables svo_angle and svo_ type will be taken into account for development.
